

SimpleRisk Release Notes

(20240205-001)

If you are not already running SimpleRisk, then you will need to [DOWNLOAD](#) it and follow the instructions for your chosen installation method. If you are currently running a previous release of SimpleRisk, then you will need to go to your Configure menu, select Register & Upgrade, and then click the “Upgrade the Application” button. This will run both the application and database upgrades to move you to the most recent release.

The complete list of changes for this release is below:

SimpleRisk Core

Usability

- Added a check in the Health Check to see if the SimpleRisk Base URL is a domain name, and if so, do a nslookup to see if it resolves. If it does not, fail the check.

Bug Fixes

- Fixed an issue where closing a risk sets its last_update field to "0000-00-00". This had negative effects on several reports, this should result in much greater accuracy on reports like “Risk Average over Time”

SimpleRisk Extras

API Extra

- Fixed an issue when you go to the API documentation page, you receive a "No operations defined in spec!" message. This should no longer be occurring.

Risk Assessment Extra

- Fixed an issue where the Questionnaires page would only display 10 results.
- Fixed an issue where drafts could not be saved without recording an answer for all questions.
- Fixed an issue where deleting a user that had previously completed an assessment would damage the records leaving them unretrievable. This fix will restore ones that were previously unable to be reviewed.
- Removed logic that silently deletes expired tracking information for assessments.

Import/Export Extra

- Fixed an issue that prevented importing assets when a custom field was being used.

Other Notes

- A SimpleRisk user noted that they were having difficulty logging in with the default username of “admin” with password of “admin”. Upon investigation, it was discovered

that PHP was enforcing secure cookies, but the application was not using SSL, so the session values were not set. This may be an isolated instance, but if you experience this issue, try installing a SSL certificate and run SimpleRisk over HTTPS to fix it.
