

## SimpleRisk Release Notes

(20220701-001)

If you are not already running SimpleRisk, then you will need to [DOWNLOAD](#) it and follow the instructions for your chosen installation method. If you are currently running a previous release of SimpleRisk, then you will need to go to your Configure menu, select Register & Upgrade, and then click the “Upgrade the Application” button. This will run both the application and database upgrades to move you to the most recent release.

**The complete list of changes for this release is below:**

### **SimpleRisk Core**

#### **New Features**

- Introduced the ability to use tags with Audit tests. This allows you to set pre-determined tags to be associated with a given audit test. This also allows users to assign a tag while initiating groups of audit tests and assign a tag or tags to be associated with all tests being ran in that batch. Once a test is completed tags can no longer be edited.

#### **Usability**

- Changed the Site/Location field for assets into a multi-select dropdown so multiple locations can be associated with a single asset.
- Added multi-lingual support for the Graphic Risk Analysis Report

#### **Security**

- Fixed an XSS in Plan Projects.
- Migrated the moment.js library to PHP Composer and updated it to the latest version.

#### **Bug Fixes**

- Added a fix to prevent an admin user from being able to save an invalid SimpleRisk Base URL.
- Fixed a bug where newly completed audits were affecting the test date of the test and currently active audit tests.
- If there was only one mapped control framework left on a control, it could not be removed. This has been fixed.
- Fixed an issue where new backups run by the scheduled backups were not showing in the UI but were still saved to the machine.
- Fixed an issue where custom risk level names did not display in the Graphical Risk Analysis.
- Fixed an issue where some error messages would display “Unabled” instead of “Unable”.
- Fixed an “implode” function call whose format was obsoleted in PHP 8. (Note: PHP 8 is not yet fully supported and we will continue to make updates to bring PHP 8 compatibility to SimpleRisk in line with the EOL of PHP 7.)

### **SimpleRisk Extras**

### **Import-Export Extra**

- Fixed an issue where CSVs were not forcibly converted to UTF8. This will most likely be the last update to the CSV style imports as we transition to XLS for import/export completely.
- Added a new column to be exported/imported called Mapped Control Numbers. When this field is populated, apply each entry (separated by commas) to each entry in the Control Frameworks field (also separated by commas).

### **Compliance Forge Extra**

- When generating a template from Compliance Forge when choosing standard risks are not being created only pass/fail status. It will now also generate risks on "no"s.

### **Other Notes**

- A SimpleRisk user noted that they were having difficulty logging in with the default username of “admin” with password of “admin”. Upon investigation, it was discovered that PHP was enforcing secure cookies, but the application was not using SSL, so the session values were not set. This may be an isolated instance, but if you experience this issue, try installing a SSL certificate and run SimpleRisk over HTTPS to fix it.
