

SimpleRisk Release Notes

(20240205-001)

If you are not already running SimpleRisk, then you will need to [DOWNLOAD](#) it and follow the instructions for your chosen installation method. If you are currently running a previous release of SimpleRisk, then you will need to go to your Configure menu, select Register & Upgrade, and then click the “Upgrade the Application” button. This will run both the application and database upgrades to move you to the most recent release.

The complete list of changes for this release is below:

SimpleRisk Core

Security

- We now invalidate existing active sessions for a user when MFA is activated for that user (other than the session used to activate MFA)
- The MFA token may now only be able to be used once within a 60 second window. It is treated as invalid if used again during that timespan
- All old generated password reset token now expire when a user changes their password.
- Matched the same rate limiting that we have for passwords to the MFA token
- Password reset links are now invalidated if the email address is changed for a user

SimpleRisk Extras

Customization Extra

- Fixed an issue with using multi-select fields on the asset template. They will now appear as intended and no longer will be a list only allowing one selection.

Notification Extra

- Fixed an issue where mitigations could report duplicates of risks.

Incident Management Extra

- Fixed an issue where the Issue Type drop down did not work when selecting a project.

Other Notes

- A SimpleRisk user noted that they were having difficulty logging in with the default username of “admin” with password of “admin”. Upon investigation, it was discovered that PHP was enforcing secure cookies, but the application was not using SSL, so the session values were not set. This may be an isolated instance, but if you experience this issue, try installing a SSL certificate and run SimpleRisk over HTTPS to fix it.
