

SimpleRisk Release Notes

(20211115-001)

If you are not already running SimpleRisk, then you will need to [DOWNLOAD](#) it and follow the instructions for your chosen installation method. If you are currently running a previous release of SimpleRisk, then you will need to go to your Configure menu, select Register & Upgrade, and then click the "Upgrade the Application" button. This will run both the application and database upgrades to move you to the most recent release.

The complete list of changes for this release is below:

SimpleRisk Core

Security

- Upgraded TinyMCE library from 5.8.2 to 5.10.0.

Bug Fixes

- Fixed an issue where when the Risk matrix is greater than 5x5, Contributing risk displays incorrect values after a value has been updated or changed after submission. The Risk score will be correct but the likelihood or impact whichever was changed would display incorrectly.
- Made an update so under the "Risks and Assets" report, we now show the "%" sign after the number for the Mitigation Percent field.
- Fixed an issue where custom fields would not be ordered correctly.
- Fixed an issue where the "Sort By" values in the Risks and Controls report show "Asset Name" and "Asset Risk" instead of "Control Name" and "Control Risk".
- Fixed arrow icon for Risk details on the Questionnaires page facing the incorrect direction.
- Fixed an issue where the framework_control_test_results_to_risks table is added by the assessment extra but is required for core functionality to work which would cause inoperability in certain circumstances.
- Fixed an issue on the compliance test creation menu where lower resolutions would not display dropdowns correctly.

SimpleRisk Extras

Risk Assessment Extra

- Added the ability to create multiple tabs in a single questionnaire so users are no longer required to display the entire assessment all at once all of the time.

Import/Export Extra

- Fixed an issue where the Dynamic Risk Report could not be exported with PHP 7.4.

Other Notes

- A SimpleRisk user noted that they were having difficulty logging in with the default

username of “admin” with password of “admin”. Upon investigation, it was discovered that PHP was enforcing secure cookies, but the application was not using SSL, so the session values were not set. This may be an isolated instance, but if you experience this issue, try installing a SSL certificate and run SimpleRisk over HTTPS to fix it.
