SimpleRisk Release Notes

(20240923-001)

If you are not already running SimpleRisk, then you will need to DOWNLOAD it and follow the instructions for your chosen installation method. If you are currently running a previous release of SimpleRisk, then you will need to go to your Configure menu, select Register & Upgrade, and then click the "Upgrade the Application" button. This will run both the application and database upgrades to move you to the most recent release.

The complete list of changes for this release is below:

SimpleRisk Core

Usability
- Updated all datepickers to the new version.

Security
- Updated jQuery EasyUI to be the latest version and set to be included via Yarn.
- Updated to datatables v2

Bug Fix
- Fixed a bug where applying a control validation mitigation percent would not override any mitigation percent defined for that control when calculating the residual risk score.
- Updated the reset_password.php page to resolve CSS files still looking for the previous UI files.
- Fixed an issue where navigating the Control Gap Analysis Report clicking on one of the Below, At or Above Maturity tabs brings you back to the top of the page.
- The AUTO_INCREMENT value on the user table increments by 1 with each new version release
- Fixed an issue where the 'New Risk' modal window on tests ('Compliance > Active Audits') did not function properly.
- Fixed an issue only experienced in load balanced and redundantly served SimpleRisk instances where the spreadsheet import functionality would fail to import intermittently when the file would upload to one server and the mapping would be sent to another server and sticky sessions could not be applied. Files now store in the database immediately.
- Fixed an issue where the print view could create errors due to old CSS still being referenced.

SimpleRisk Extras

Upgrade Extra

- Added additional functionality to help resolve issues with libraries that have been moved/renamed/retired; these files will be refreshed during the upgrade process to prevent this issue with future releases.

Custom Authentication Extra
- Fixed an issue with SAML authentication in the is_valid_saml_user function that could prevent login.

Import\Export Extra
- Exports of Risks display the review information associated with the first review rather than the latest review.
- Previous risk ID returned when importing a risk with no subject
- Audit Trail exports from Configure -> Audit Trail are presenting as corrupt when trying to open them
- Fixed an issue where the previous risk ID returned when importing a risk with no subject.

Incident Management Extra

- Fixed a 403 Forbidden scenario associated with a jquery-ui image when hitting the Incident Management -> Reporting -> Overview page.

<u>Other Notes</u>

- A SimpleRisk user noted that they were having difficulty logging in with the default username of "admin" with password of "admin". Upon investigation, it was discovered that PHP was enforcing secure cookies, but the application was not using SSL, so the session values were not set. This may be an isolated instance, but if you experience this issue, try installing a SSL certificate and run SimpleRisk over HTTPS to fix it.
