SimpleRisk Release Notes

Version: 20261105-001

SimpleRisk 20261105-001 is a release about keeping things running and keeping you informed. The Queue Monitor has been rebuilt from the ground up, upgrades are more dependable than ever, and the screens you use to manage values and review risks got a thoughtful refresh — along with a long list of fixes across questionnaires, reporting, and sign-in.

If you are not currently running SimpleRisk, please download the application and follow the installation instructions for your preferred method.

If you are running a previous release, navigate to **Configure** → **Register & Upgrade** and click **Upgrade the Application**. This process upgrades both the application and the database to the latest release.

SimpleRisk

SimpleRisk Core

New Functionality

- Redesigned the Queue Monitor with live updates, search, filters, and an expandable step view for each task. You can stop, cancel, restart, or run tasks now, individually or in bulk, and delete or filter finished tasks. The Queue Monitor shows worker health, raises an alert when a background task fails permanently, and cleans up old finished tasks automatically. It also lays out cleanly on tablets and phones. Optional `config.php` settings tune queue worker memory, runtime, retry, and recovery behavior, and allow more than one queue or promise worker. Canceled tasks no longer keep running their remaining steps, tasks for deleted records no longer repeat and delay other work, a worker crash no longer leaves tasks stalled or endlessly re-queued, and AI service calls now have time limits. Interactive tasks now run ahead of document updates and bulk AI work, and workflow tasks and asset discovery runs no longer wait behind everything else. **Breaking:** the response of the existing `GET /api/v2/admin/queue` endpoint now returns `rows`, `total`, `filtered`, and `status_counts` instead of the DataTables shape; integrations that read it must be updated.
- Administrators can now choose between the Production and Release Candidate update channels.
- Everyone now receives an in-app notification after SimpleRisk is upgraded, linking to the release notes.

Bug Fix

- Fixed the Management Reviews by Date and Closed Risks by Date reports showing incomplete results for customers using the Team-Based Separation Extra.
- Fixed the Mitigation and Management Review sections of a risk's details page appearing empty for customers using the Team-Based Separation Extra.
- Fixed Mitigation Supporting Documentation uploaded before a mitigation's first save being removed when the mitigation was saved, and mitigation notification emails listing out-of-date supporting documentation.
- Fixed column names and filter labels in some reports and exports showing HTML codes such as `&` instead of the character.

- Password reset: a failed reset email is now logged, an administrator resetting a user's password is told when the email could not be sent, and a mismatched Base URL gives a clearer message. Completing a password reset now also unlocks an account that was locked out after too many failed logins.
- Backup downloads now report errors instead of showing a blank page, and an interrupted download can be resumed.
- Deleting a test audit now also removes its results and evidence files, so they no longer appear on a later audit that reuses the ID.
- A page that loses its session now shows an error notification telling you to sign in again instead of a raw "Ajax error" alert or a table stuck on "Loading...", and DataTables-backed pages no longer fail when a table loads without its server-side settings.
- Document Program: documents with no team or stakeholder open for editing again, an approved document records its last review date, file names containing & display correctly in version history, and the Columns picker works for the columns folded away on narrower screens. `POST /api/v2/documents/create` and `/update` now answer 400 with the names of any missing required fields instead of a server error.
- Approving an exception or a document with a Review Frequency of 0 no longer clears its Next Review Date.
- A Pending exception whose review date has passed can now be edited without also having to change the review date.
- The Edit Framework parent picker no longer loses the parent when it has a different Active or Inactive status.
- Add and Remove Values now refuses an over-long value with a message instead of silently cutting it off.
- The Dynamic Risk Report no longer resets its Status filter to Open Risks when you change columns, remembers your selected columns across page loads, and saves a selection even when a dropdown column filter is empty.
- The Review Risks page and the dashboard risk graphs load faster on instances with many catalog, control, and custom-field mappings. The Review Risk grid no longer fails on risks that were reviewed more than once when a dropdown custom field is active, and the Review Risk summary tiles now count exactly the risks the grid can show.
- Fixed the Statement of Applicability showing "No risk linked" for a linked risk that has no mitigation yet; it now reads "No mitigation planned".
- The admin Update an Existing User page now keeps the user's language instead of showing a blank dropdown and resetting it on save.

- The Connectivity Explorer now colors test results green for Pass and red for Fail, and its "Show types" menu is no longer blank for items with no connections.
- The Risk Charts dashboard widgets are now each labeled with what they show instead of all reading "Reviewed vs Unreviewed".
- The web installer now works on MySQL servers that enforce a password policy, and cleans up after itself if the database user cannot be created.
- Uploads show a clear message instead of an error page when the PHP fileinfo extension is missing.
- Upload size limits are read correctly on MySQL 8.0.30 and later.
- A language key missing from a custom or partially translated language file now falls back to English instead of showing an error page.
- Fixed a database upgrade from 20251118-001 failing with a duplicate-key error on the risk catalog.
- Fixed the registration page showing "Update available" right after an upgrade, and Extras not being offered for upgrade right after a Core upgrade.
- Instances that cannot reach the internet no longer wait on the update check on every page.
- Replaced the live country list, which could fail in the background, with a built-in list.
- Links and bookmarks to pages removed in earlier releases now take you to the page that replaced them instead of showing a "not found" error. The Extras' internal library folders are no longer reachable from the web.
- Improved reliability when an Extra's files are missing from an installation.
- Deactivating an Extra no longer reports "Activation could not start" when a guard check fails.
- After an Extra is installed or updated, SimpleRisk now runs the new version right away.

Security Issues

- Hardened the password reset flow.
- Hardened the database-upgrade login page.

Performance / Availability

- When the database is at its connection limit, SimpleRisk now retries briefly before failing and responds with a temporary "try again" status instead of an error page. Two new

optional `config.php` settings let administrators limit how many database connections a server uses at once.

- Improved the performance and reliability of session cleanup on busy instances.

Aesthetics / User-Interface

- Redesigned Add and Remove Values. Lists are grouped by area with a search across list names and values, each value shows where it is used, and deleting a value that records use lets you move those records to another value first. The built-in risk statuses are now protected from rename and delete.
- Rows on the Review Risk grid and the Manage Assets Assets tab can now be clicked to open the risk or asset.

Language Updates

- Improved the accuracy of translations across all supported languages.

SimpleRisk

SimpleRisk Extras

Extra Updates

- Assessments: Pre-filled questionnaire answers no longer disappear when a questionnaire is saved part-way, and autosave now saves only the question you changed.
- Assessments: Assessment imports now split a Tags, Affected Assets, or Mapped Controls cell that lists several entries into separate entries.
- Assessments: Risk Analysis now shows an added risk's own current details, read-only.
- Assessments: Questionnaire answer choices no longer display as literal HTML tags, and the Team and Owner dropdowns select the right option when adding a questionnaire.
- Assessments: A failed questionnaire submission, and questionnaire completion notifications, now leave a record in the Questionnaire Audit Trail, and the notification emails link to the right place.
- Assessments: A questionnaire with a required multiple-choice question that has no answer choices can be completed again; such questions are flagged with a warning in the Questionnaire Questions list, and the template import no longer creates new multiple-choice questions as required.
- Assessments: A respondent can complete a questionnaire with a required Fill in the Blank question, an Approved questionnaire result can be reopened again, and searching Questionnaire Questions by number finds that question ID.
- Assessments: Completed results keep showing the answer that was given after a template's answer option is edited or removed.
- Assessments: Pending Risks no longer fail after the first risk, one failing pending-risk score no longer hides the other pending risks, and resubmitting a questionnaire no longer regenerates pending risks that were already converted to real risks.
- Authentication: A SAML login that does not carry the role or teams attribute can now keep the user's current role and teams, through a new setting that is off by default (off resets them to the default role), and a user with several role values now gets the first one that is mapped.
- Authentication: Fixed SAML sign-in for identity providers registered with the older SimpleRisk SAML address, and sign-in failing after an update because of a stale cache.

A rejected SAML response now always shows a clear "Sign-in could not be completed" page with a 4xx status instead of a server error.

- Authentication: Fixed self-hosted SAML sign-in breaking after an in-app Core upgrade because a cleanup step failed silently.
- Import/Export: The controls export and import now use the Control ID shown in SimpleRisk, and carry each control's Mapped Control Frameworks and per-framework Applicability. Files exported before this release carry raw database IDs: map their plain Control ID column to the new "Control ID (database ID, legacy export)" field, or re-export. If a file's header row contradicts the mapping, the whole import is refused and nothing is written.
- Import/Export: Re-importing a risk CSV now reports Scoring Method, Classic Likelihood, or Classic Impact values it does not recognize and leaves the risk's existing scoring unchanged; Classic Likelihood and Impact also accept the numbers 1 to 5. Importing with no file chosen now shows a message, and a custom-field cell containing `0` is no longer discarded.
- Customization: The template-group screen stays available to customers who already have more than one template group, even without the Organizational Hierarchy Extra.
- Incident Management: Deleting evidence from an incident now keeps you on that incident instead of showing a "does not exist or you do not have permission" page.
- ComplianceForge SCF: The maturity level descriptions (CMM 0 to 5) now import from SCF 2026.2 and later workbooks. Instances that already imported a 2026.2 or 2026.3 workbook get them filled in the next time the SCF content is imported, which the upgrade does automatically.
- Vulnerability Management: When a Tenable.io import cannot match the exported vulnerabilities to your assets, the log now explains why.
- Unified Compliance Framework (UCF): The Extra has been retired and removed.
- Upgrade: The one-click upgrade now upgrades the database of each Extra it updates, if the Extra is enabled, as its own step after the Extras' files are replaced, and then restarts the queue workers. It reports a failure, naming the Extras involved, when an Extra cannot be downloaded or its database cannot be upgraded, instead of "Upgrade Complete." It uses the Backups path configured under Configure > Backups when it can, and it works on older PHP versions and older SimpleRisk releases.
- Upgrade: After the Upgrade Extra updates itself, a web server restart is no longer needed.
- API: New administrator-only `GET /api/v2/admin/extras/status` lists every Extra with whether it is installed and enabled, its version, and the route that upgrades its

database. New administrator-only `POST /api/v2/admin/extras/upgrade-databases` upgrades the database of every installed, enabled Extra in one call, for deployments that replace the code without the one-click upgrade (container image swaps, scripted and hosted deployments); call it once after the core database upgrade. It answers `409` while another upgrade is running.

- API: The documentation now covers the Customization, Encrypted Database, and Import-Export Extras' endpoints, and `ai`, `im`, and `scf` are accepted as short names for the Artificial Intelligence, Incident Management, and Secure Controls Framework Extras in the Upgrade Extra's per-Extra update endpoints.
- Extras: The database-upgrade routes of the Advanced Search, Artificial Intelligence, API, Risk Assessment, Custom Authentication, Customization, Encrypted Database, Import-Export, Incident Management, Jira, Email Notification, Organizational Hierarchy, Team-Based Separation, Vulnerability Management, and Workflows Extras, and the Secure Controls Framework `/scf/upgrade` route, now accept `POST` only and answer a `GET` with 404. **Breaking:** scripts that call them must switch to `POST`.
