SimpleRisk Release Notes

Version: 20261020-001

This is a search-and-stability release: Advanced Search now reaches across the whole platform from the top bar, the one-click upgrade is substantially more resilient, and a broad round of security hardening and bug fixes rounds out the release.

If you are not currently running SimpleRisk, please download the application and follow the installation instructions for your preferred method.

If you are running a previous release, navigate to **Configure → Register & Upgrade** and click **Upgrade the Application**. This process upgrades both the application and the database to the latest release.

SimpleRisk

SimpleRisk Core

Bug Fix

- Fixed the Update button staying disabled after editing a test on Define Tests.
- Fixed the Approver shown when editing a test sometimes carrying over from the previously edited test.
- Fixed Edit Test opening in Calendar mode, and demanding an Anchor Date, for tests created by import.
- Fixed the Add Exception window keeping old entries after Cancel.
- Corrected the description of the Comment on Risks permission so it says what it actually covers.
- Fixed leftover data remaining when contributing risks are removed from the risk formula.
- Fixed directory cleanup on Windows servers so it no longer hangs on a confirmation prompt.
- Report and risk list pages no longer rebuild the risk field label table for every column.
- Saving a setting is no longer skipped when another process had already changed it.
- A background task waiting to retry no longer blocks other queued tasks.
- Removed two PHP warnings that could appear on the risk tags API and on compliance test comments.
- Due-date day counts are no longer off by one around daylight-saving changes.
- Saving an asset without changing anything no longer adds an audit-log entry or triggers asset workflows.
- Closing the asset window after switching from View to Edit no longer lets the browser Back button reopen the record.
- Testers without Risk Management access can submit active-audit test results again.
- Stopped recording blank-user "logged out" entries in the audit log.
- Fixed the User Management breadcrumb on the Update User page.
- Deleted audits are no longer recreated by the audit scheduler, and the audit screen now explains where Additional Stakeholders are edited.
- Fixed the Plan Mitigation and Perform Review tabs not displaying without the Customization Extra.
- Removing a framework from a control's Mapped Control Frameworks now sticks after you click Update.

SimpleRisk

- The column filters on the Document to Control Mappings report now work, including the Yes/No filters in non-English languages.
- Attaching a file larger than the PHP or MySQL limit (to a risk, mitigation, control test, document, exception, incident, or questionnaire) no longer fails with a server error; the attachment is refused with a message and the rest of the form is handled as before.
- The maximum upload file size on the File Upload settings page can no longer be set above what PHP and MySQL allow, and attachment forms now show and check the real limit.
- Corrected the API documentation for asset lookups and Statement of Applicability exports.

Security Issues

- Added an optional HTTP Strict Transport Security (HSTS) setting under Configure > Security.
- Hardened how several Extra actions are requested. Scripts that call the AI document-install or Vulnerability Management full-sync endpoints directly must now use POST.
- Hardened a credential comparison in the Assessments Extra.
- Hardened input validation in the risk mitigation API.
- Hardened sanitization of workflow email content.
- Hardened validation of saved Review Risk column settings.
- Hardened access controls on audit visibility when Team Separation is enabled.

Performance / Availability

- Outbound connection retries now back off progressively instead of retrying at a fixed interval.

Aesthetics / User-Interface

- Nested frameworks in the Define Control Frameworks rail are now indented one step further per level.
- Improved the Plan Projects toolbar layout on narrow screens.
- The top-bar search box now has a single, consistent hover state.

Code Cleanup

- The Reports Hub now sorts report names using the rules of the selected language.

SimpleRisk

SimpleRisk Extras

Extra Updates

- Advanced Search now searches risks, frameworks, controls, documents, exceptions, tests, audits, assets, and asset groups (plus incidents, assessments, and vulnerabilities when those Extras are active) from the top bar, with a full Search page, a connected-records view, and shareable result links. **Breaking:** the unused GET /advanced_search API route has been removed; use /advanced_search/results?type=risk or /advanced_search/suggest instead.
- Upgrade: Fixed one-click upgrades failing partway and leaving the instance unavailable.
- Upgrade: The one-click upgrade's database backup now connects on the configured database port.
- Upgrade: A failed Extra download during the one-click upgrade now shows why it failed.
- Upgrade: The database upgrade page no longer prints "headers already sent" warnings.
- Upgrade: The database-upgrade failure message now names the database version.
- Upgrade: A failed Upgrade Extra self-update is now reported as an update failure instead of "Backup Failed".
- Vulnerability Management: Tenable assets are now named by hostname when scans target IP ranges.
- Vulnerability Management: Fixed Tenable syncs leaving assets without their associated risks.
- Import/Export: Large user imports now run in the background with a progress view, and rows with a blank username or full name are skipped.
- Import/Export: Importing a Closed risk without a Close Reason now shows a warning.
- Import/Export: Excel exports of risks, assets, and controls no longer show HTML entities such as & in cells.
- Import/Export: Fixed re-imported categories, teams, and similar long names creating duplicates.
- Assessments: Sending a questionnaire for the first time no longer asks whether to pre-populate answers.
- Assessments: Attaching a file larger than the upload limit to a questionnaire is now rejected immediately, and a draft save reports any attachment it could not store.

SimpleRisk

- Assessments: Generating a questionnaire template from Secure Controls Framework controls now shows a progress indicator and ignores repeat clicks.
- Assessments: Deleting an assessment now also deletes the files uploaded with its answers.
- Assessments: Questions created from Secure Controls Framework controls are now Required by default, and saving a questionnaire question returns you to the question list.
- Assessments: Added stable operation names to the Assessments API documentation.
- ComplianceForge SCF: The Update button is no longer shown when the Secure Controls Framework is already up to date.
- ComplianceForge SCF: Corrected existing SCF-generated questions that were not marked Required.
- AI: Saving AI provider settings without an API key no longer sends a request to the hosted provider.
- Notification: Updating a document that has no file no longer fails when the Notification Extra is on.
- API: Disabling the API Extra now deletes all users' API keys; keys must be regenerated after the Extra is re-enabled.
- Authentication: The SAML service provider metadata link on the Custom Authentication page now uses the current SimpleSAMLphp address.
