

SimpleRisk Release Notes

Version: 20260908-001

This release adds a new Data Integrity tool, a redesigned Document Program and Define Exceptions experience, and a broad set of security hardening fixes across authorization, session handling, and single sign-on.

If you are not currently running SimpleRisk, please download the application and follow the installation instructions for your preferred method.

If you are running a previous release, navigate to **Configure** → **Register & Upgrade** and click **Upgrade the Application**. This process upgrades both the application and the database to the latest release.

SimpleRisk Core

Security Issues

- Fixed numerous authorization issues across risk, asset, and governance management that could allow a user to view, modify, or delete data outside their assigned team or permission scope.
- Fixed authorization gaps in Governance, Compliance, and Assessments that could expose data across permission boundaries.
- Strengthened team-based separation checks across document and exception approvals, downloads, and audit logs.
- Strengthened audit approval workflow integrity, closing gaps that could allow a closed audit's evidence to be altered, a duplicate audit to be created, or an approver to approve their own submitted result.
- Fixed two issues where user-supplied content in workflow and audit notifications could be rendered as active markup instead of plain text.
- Changed an administrative action to require a safer request method.
- Fixed two race conditions that could create duplicate records under concurrent requests.
- Strengthened session handling after a password change.

New Functionality

- Added a Data Integrity page that finds and helps repair corrupted text and file uploads.
- Redesigned the Document Program and Define Exceptions pages with insights tiles, a rebuildable audit trail, version history, bulk actions, and a Columns picker.
- Added review-due email notifications for documents and policy exceptions.

Bug Fix

- Fixed a false "action disabled" message shown on the demo instance when saving without an attachment.
- Fixed an authorization issue that could expose risk dashboard data across teams.
- Fixed an issue where the Dynamic Risk Report could fail to load with certain risk scoring data.
- Fixed the risk-closed notification email showing a raw code instead of the closure reason.
- Added a way to see which frameworks a control is mapped to, right from the controls table.
- Fixed dashboard widgets showing encrypted text instead of risk names when Database Encryption is enabled.
- Fixed intermittent errors when logging out or resetting a password under load.
- Fixed an error that could interrupt a database upgrade spanning multiple releases.
- Default automated workflows (risk notifications, etc.) now require the Workflows Extra instead of running unconditionally on every install.
- Fixed an error that could prevent the Document Program page from loading.
- Fixed a repeated warning in the server log on every SAML login when the metadata schema file could not be read.
- Hardened the default SAML single sign-on configuration shipped with the release.
- Fixed an issue where bulk-deleting documents in Document Program could fail with an error.

SimpleRisk Extras

Customization

- Redesigned the Customization admin page around Template Groups and Custom Fields.
- Extended template groups to cover Assets, Projects, Frameworks, and Controls.
- Added a Document field group for managing document types (Policies, Guidelines, Standards, Procedures, and any custom types).
- Fixed an authorization issue in template-group assignment on record creation.

Organizational Hierarchy

- Added business-unit assignment for the new template groups.
- Fixed issues where the Default Business Unit could be corrupted or deleted, breaking business unit management.
- Improved performance when refreshing users' business unit assignments.

Upgrade

- Upgrade backups no longer live in a temporary directory that a service restart can silently wipe.
- Strengthened file-permission and ownership checks when an upgrade creates its backup files.

ComplianceForge SCF

- Fixed missing source-mapping data and a stuck-upgrade issue on the ComplianceForge SCF 2026.2 release.

Encrypted Database

- Fixed a background migration job that could fail to re-encrypt stale data with Database Encryption enabled.
- Reduced unnecessary decryption work on the Define Exceptions page.

Custom Authentication

- Replaced a fixed default single sign-on administrator credential with a unique, per-install value.
- Removed an unused SAML single sign-on administrative credential from the stored configuration.

API

- Strengthened API key storage.

Notification

- Fixed scheduled report "Run Now" buttons showing the wrong confirmation message for some report types.

Assessments

- Fixed the Risk Assessment checkbox not reflecting its correct state on reused Standard/Maturity questionnaire questions.
